

Day 1: Overview of Hardware Components

Easy-to-Learn Hardware Notes & Assignment Answers

1. Labeled Diagram of a Desktop PC

Component	Easy Meaning
Motherboard	Main board that connects all computer components.
CPU	Main processor that performs calculations and instructions.
RAM	Temporary memory used while programs are running.
GPU	Handles graphics, images, and gaming visuals.
HDD	Large storage with moving parts; usually slower.
SSD	Fast storage with no moving parts.

2. HDD vs SSD Comparison

Feature	HDD	SSD
Full Form	Hard Disk Drive	Solid State Drive
Speed	Slower	Faster
Durability	Less resistant to shocks	More resistant to shocks
Moving Parts	Yes	No
Noise	Can make some noise	Silent
Boot Time	Slower	Faster

Feature	HDD	SSD
Game Loading	Slower	Faster
Typical Use	Large storage, backups	OS, apps, games
Common Use	Desktop/external storage	Laptops/gaming PCs
Price per GB	Usually cheaper	Usually more expensive

Easy memory: HDD = Big + Cheap + Slow | SSD = Fast + Strong + Silent

3. CPU, RAM and GPU in PUBG / Free Fire

CPU – Central Processing Unit

The CPU processes the game's instructions and handles things such as game logic, player movements and other calculations. A good CPU helps the game run smoothly, especially when many things are happening at the same time.

RAM – Random Access Memory

RAM temporarily stores the data that the game needs while it is running. More suitable RAM helps the computer run the game along with other programs without slowing down too much.

GPU – Graphics Processing Unit

The GPU creates and displays the game's graphics, such as characters, maps, lighting and effects. A better GPU can help provide smoother gameplay and higher graphics settings, depending on the game and the rest of the PC.

4. Upgrading a PC for FIFA

Component	Why Upgrade It?
GPU	A better GPU can improve graphics quality and game performance.
CPU	A stronger CPU can process game calculations more efficiently.
RAM	More suitable RAM helps the game and other programs run smoothly together.
SSD	An SSD can make Windows, games and loading screens faster.
Power Supply (PSU)	A stronger GPU may require an adequate power supply.
Cooling	Better cooling can help keep the CPU/GPU at suitable temperatures during gaming.

■ Quick Revision

GAMING PC

GPU → Graphics & Game Performance
CPU → Game Logic & Calculations
RAM → Smooth Running / Temporary Memory
SSD → Faster Loading
PSU → Provides Power
Cooling → Helps Control Temperature

Simple upgrade idea: GPU + CPU + RAM → mainly for game performance | SSD → mainly for faster loading | PSU + Cooling → support upgraded components
